

# Ultrasonics: The System of Periodontal Therapy

Dental professionals do not want their patients to hurt during treatment. Patients seldom understand that oral disease is what causes their pain.

Patients want painless oral health care from dental professionals who have achieved clinical confidence in higher functioning skills, along with systems that make them unique and different. Ultrasonic treatment is the most revolutionary system available to take dental care to the next level of superior client service. It helps meet the demands of today's non-surgical periodontal therapy. This course uses examples and data from the speaker's hands-on experience and scientific research in order to challenge and motivate the participant to utilize innovative ultrasonic technology.

## The result:

Patients who achieve optimum oral health with as little pain or discomfort as possible.

*"I found the speaker maintained my interest throughout the entire presentation. Well presented and good flow of material. **Profound message.**"*

## Learning Objectives:

- ✓ Describe the benefits of ultrasonic technology for both patient and provider
- ✓ Demonstrate increased skills and competence when using ultrasonic systems
- ✓ Explain the results achieved through ultrasonic therapy and non-surgical periodontal treatment
- ✓ Create a professional development plan to learn and implement periodontal therapy

**Suggested Attendees:** Dental Hygienist, Dentist

**Suggested Format:** Half Day; Lecture, Workshop, Keynote
